**CLAIM AMENDMENTS** 

**Claim Amendment Summary** 

Claims pending

• Before this Amendment: Claims 1-41.

After this Amendment: Claims 1-41.

Non-Elected, Canceled, or Withdrawn claims: None.

**Amended claims**: Claims 1, 5, 11, 18, 19, 24, 26, 31, 36 and 41.

New claims: None.

Claims:

1. (Currently Amended) A software architecture implemented at least in part

by a computing device for a distributed computing system comprising:

a plurality of applications configured to handle requests submitted by remote

devices over a network, wherein the plurality of applications are written in different

programming languages;

an application program interface to present functions used by the plurality of

applications to access network and computing resources of the distributed computing

system; and

a common language runtime layer that translates the plurality of applications

written in different programming languages into an intermediate language, the

-6-

intermediate language being:

Serial No.: 10/087,027 Atty Docket No.: MS1 -0861USC1

Atty/Agent: Jacob P. Rohwer

www.ipetopps.com 300.300.9200

executed natively by the common language runtime layer; and

configured to access resources or services requested by the remote devices,

whereby a seamless integration between multi-language application development

is allowed and a robust and secure execution environment for multiple

programming languages is provided.

2. (Previously Presented) The software architecture as recited in claim 1,

wherein the distributed computing system comprises client devices and server devices

that handle requests from the client devices, the remote devices comprising at least one

client device.

3. (Previously Presented) The software architecture as recited in claim 1,

wherein the distributed computing system comprises client devices and server devices

that handle requests from the client devices, the remote devices comprising at least one

server device that is configured as a Web server.

4. (Previously Presented) The software architecture as recited in claim 1,

wherein the application program interface comprises:

a first group of services related to creating Web applications;

a second group of services related to constructing client applications;

a third group of services related to data and handling XML documents; and

a fourth group of services related to base class libraries.

Serial No.: 10/087,027 Atty Docket No.: MS1 -0861USC1

Atty/Agent: Jacob P. Rohwer

-7-

5. (Currently Amended) An application program interface embodied on one

or more computer readable storage media, comprising:

a first group of services related to creating Web applications;

a second group of services related to constructing client applications;

a third group of services related to data and handling XML documents; and

a fourth group of services related to base class libraries; and

a common language runtime layer that translates Web applications written in

different programming languages into an intermediate language, the intermediate

language being:

executed natively by the common language runtime layer; and

configured to access resources or services, whereby a seamless integration

between multi-language application development is allowed and a robust and

secure execution environment for multiple programming languages is provided,

wherein the seamless integration allows for the ability to use a particular code

module written in a first programming language with a code module written in a

second programming language.

**6.** (Previously Presented) The application program interface as recited in

claim 5, wherein the first group of services comprises:

first functions that enable construction and use of Web services;

second functions that enable temporary caching of frequently used resources;

third functions that enable initial configuration;

Serial No.: 10/087,027 Atty Docket No.: MS1 -0861USC1

Atty/Agent: Jacob P. Rohwer

ECCIONS The Susiness of 17 18

-8-

fourth functions that enable creation of controls and Web pages;

fifth functions that enable security in Web server applications; and

sixth functions that enable access to session state values.

7. (Previously Presented) The application program interface as recited in

claim 5, wherein the second group of services comprises:

first functions that enable creation of windowing graphical user interface

environments; and

second functions that enable graphical functionality.

8. (Previously Presented) The application program interface as recited in

claim 5, wherein the third group of services comprises:

first functions that enable management of data from multiple data sources; and

second functions that enable XML processing.

9. (Previously Presented) The application program interface as recited in

claim 5, wherein the fourth group of services comprises:

first functions that enable definitions of various collections of objects;

second functions that enable programmatic access to configuration settings and

handling of errors in configuration files;

third functions that enable application debugging and code execution tracing;

Serial No.: 10/087,027 Atty Docket No.: MS1 -0861USC1

Atty/Agent: Jacob P. Rohwer

fourth functions that enable customization of data according to cultural related

information;

fifth functions that enable input/output of data;

sixth functions that enable a programming interface to network protocols;

seventh functions that enable a managed view of types, methods, and fields;

eighth functions that enable creation, storage and management of various culture-

specific resources;

ninth functions that enable system security and permissions;

tenth functions that enable installation and running of services;

eleventh functions that enable character encoding;

twelfth functions that enable multi-threaded programming; and

thirteenth functions that facilitate runtime operations.

10. (Original) A network software architecture comprising the application

program interface as recited in claim 5.

11. (Currently Amended) A distributed computer software architecture

implemented at least in part by a computing device, comprising:

one or more applications[[,]] written in different programming languages and

configured to be executed on one or more computing devices, the one or more

applications written in different programming languages handling requests submitted

-10-

from remote computing devices;

Serial No.: 10/087,027 Atty Docket No.: MS1 -0861USC1

a networking platform to support the one or more applications;

an application programming interface to interface the one or more applications

with the networking platform; and

a common language runtime layer that translates the one or more applications

written in different <u>programming</u> languages into an intermediate language being executed

natively by the common runtime layer and configured to access resources or services

requested by the remote devices, whereby a seamless integration between the one or more

applications developed with multiple programming languages and the computing device

multi-language application development is provided.

12. (Previously Presented) The distributed computer software architecture as

recited in claim 11, further comprising a remote application configured to be executed on

one of the remote computing devices, the remote application using the application

programming interface to access the networking platform.

13. (Previously Presented) The distributed computer software architecture as

recited in claim 11, wherein the application programming interface comprises:

a first group of services related to creating Web applications;

a second group of services related to constructing client applications;

a third group of services related to data and handling XML documents; and

a fourth group of services related to base class libraries.

**18.** (Currently Amended) A computer system comprising:

one or more microprocessors; and

one or more software programs that are written in different programming

languages and utilize an application program interface to request services from an

operating system through a common language runtime layer, the application program

interface comprising:

separate commands to request services consisting of the following groups

of services:

A. a first group of services related to creating Web applications, the

first group of services comprising:

constructing Web services;

temporary caching resources;

performing initial configuration;

creating controls and Web pages;

enabling security in Web server applications; and

accessing session state values;

B. a second group of services related to constructing client

applications, the second group of services comprising:

creating windowing graphical user interface environments;

and

enabling graphical functionality;

Serial No.: 10/087,027 Atty Docket No.: MS1 -0861USC1

Atty/Agent: Jacob P. Rohwer

C. a third group of services related to data and handling XML documents, the third group of services comprising:

enabling management of data from multiple data sources; and second functions that enable XML processing.

D. a fourth group of services related to base class libraries, the fourth group of services comprising:

defining various collections of objects;

accessing configuration settings and handling errors in configuration files;

debugging and tracing code execution;

customizing data according to cultural related information;

inputting and outputting of data;

enabling a programming interface to network protocols;

viewing loaded types, methods, and fields;

creating, storing and managing various culture-specific

resources;

enabling system security and permissions;

installing and running services;

enabling character encoding;

enabling multi-threaded programming; and

facilitating runtime operations; and

ENGINES The Susiness of 17 to

development, with cross language inheritance and translates the one or more software

programs written in different programming languages into an intermediate language,

wherein the intermediate language is executed natively by the common language runtime

layer and is configured to access the services requested by the one or more software

programs.

19. (Currently Amended) A system comprising:

one or more microprocessors; and

a memory storing one or more software programs comprising computer-

executable instructions executable by the one or more microprocessors, the one or more

software programs comprising:

means for exposing a first set of functions that enable browser/server

communication;

means for exposing a second set of functions that enable drawing and

construction of client applications;

means for exposing a third set of functions that enable connectivity to data

sources and XML functionality; and

means for exposing a fourth set of functions that enable system and runtime

functionality; and

means for translating Web applications written in different programming

languages into an intermediate language,

Serial No.: 10/087,027

common <u>language</u> runtime layer and is configured to access the network and computing resources requested by the developers, whereby a seamless integration provides a robust

and secure execution environment for multiple programming languages.

25. (Previously Presented) The method as recited in claim 24, further

comprising receiving a request from a remote computing device, the request containing a

call to at least one of the first, second, third, and fourth functions.

**26.** (Currently Amended) A method implemented at least in part by a

computer, the method comprising:

creating a first namespace with functions that enable browser/server

communication;

creating a second namespace with functions that enable drawing and construction

of client applications;

creating a third namespace with functions that enable connectivity to data sources

and XML functionality;

creating a fourth namespace with functions that enable system and runtime

functionality; and

providing a common language runtime layer that translates Web applications

written in different programming languages into an intermediate language,

the intermediate language being:

executed natively by the common <u>language</u> runtime layer; and
